Centrifugal fans consist of an impeller in a casing having a spirally shaped contour. The air enters the impeller in an axial direction and is discharged at the impeller outer periphery. The air flow moves along the centrifugal direction (or radial direction). Sometimes centrifugal fans are called radial flow type fans.

Centrifugal Fan - an overview | ScienceDirect Topics
Centrifugal fans use a rotating impeller to move air first radially outwards by centrifugal action, and then tangentially away from the blade tips. • Incoming air moves parallel to the impeller hub and it turns radially outwards towards the perimeter of the impeller and blade tips.

A centrifugal fan is a mechanical device for moving air or other gases in a direction at an angle to the incoming fluid. Centrifugal fans often contain a ducted housing to direct outgoing air in a specific direction or across a heat sink; such a fan is also called a blower, blower fan, biscuit blower, or squirrel-cage fan. These fans increase the speed and volume of an air stream with the rotating impellers. Centrifugal fans use the kinetic energy of the impellers to increase the volume of the a

Centrifugal fan - Wikipedia
Centrifugal fans are further classified on the basis of impeller design geometry: backward curved, airfoil, radial, and forward curved. The backward curved and the airfoil fans have the highest efficiencies among centrifugal fans. Axial fans move the air parallel to the axis of rotation. Axial fans are used to generate lower pressures (less than 12-in. w.g.) while handling large airflow rates.

Centrifugal fans with forward blades are suited for application with higher air flow volumes and pressures. Axial propeller fans are more suited for applications with lower volumes and pressures. Axial and Propeller Fans. In an axial fan the air flows in parallel to the shaft. It is common to classify axial fans upon their wheel like:

An axial fan is a type of fan that causes gas to flow through it in an axial direction, parallel to the shaft about which the blades rotate. The flow is axial at entry and exit. The fan is designed to produce a pressure difference, and hence force, to cause a flow through the fan.Factors which determine the performance of the fan include the number and shape of the blades.

Axial fan design - Wikipedia
There are a number of fan types: impeller, axial, centrifugal.A. Sirocco, etc. all of which have individual benefits (volume, pressure, speed, power, efficiency, etc.) but all of them will shift gases at the same rate based upon the input power. Differences such as efficiency or flow rate occur in the type of fan due to particular design advantages that favour one characteristic over another.

5. FANS AND BLOWERS
There are different types of Centrifugal Fans covering air volumes from 85 to 100,000m³/hr and from 25 to 15,000 PA. Each application requires a fan with different characteristics, whether it be the blade design, the width of the casing or even the method of drive.
