Electromechanical transients happen when the electrical power produced by a generator is no longer equal to the mechanical power that drives the generator itself (this power coming from a turbine powered by water or steam), causing the generator to either speed up or slow down compared to its normal rotation speed.

Electrical engineering. In electrical engineering, oscillation is an effect caused by a transient response of a circuit or system. It is a momentary event preceding the steady state (electronics) during a sudden change of a circuit or start-up. Most circuit principles such as inductor volt-second balance, capacitor ampere-second balance ignore transient states and are valid only for steady state.
